Not illustrated. 1904 Excerpt: .the numerical value of t that is required ; but if we retain the signs we can see the value of Q as follows--the upper signs are for the point of beginning of the duration, and the lower for the point of ending: $L \sin Q = \pm 2 L O M$ (223) $L \cos Q = -g$ -Taking the lower signs, Q is an obtuse angle; and with the upper, an acute angle taken negatively--the values differing 180 from one another. In Fig. 15, supposing the circles to now represent the umbral shadow, while we plot for the northern limiting curve $Q = AMe$, we have here for duration for the point of beginning $Q = AMm-BnM$, which is laid off in the direction of the path, the points m and n forming the duration. A total eclipse would reverse the conditions of the signs, on account of the negative value of L . We read in the section on Limits that the path of the shadow on the earth's surface is shortened from the distance on the fundamental plane, and the office of Q is here to diminish the radius of the umbral cone proportionately, so that instead of the duration depending upon the radius $nM = Mm$, it depends upon the line ms , which is proportionate to Mm , as $\sin Q$ is to unity. It is as well to know these facts about the angle Q , but they are given here not as...
